## How to Use the Synonymy

The synonymy lists all genera that were included in source manuals or were accepted for the U.S. regions by the Smithsonian Institution. The synonymy does not include all accepted names, so do not use it unless you have first looked in the list for the region you are concerned with.

If you have checked the list covering the appropriate region and have not found the name you were seeking, look it up alphabetically by genus in the synonymy. Within the genus, species are also listed alphabetically. When you look up the species, you will find one of the following cases:

“Accepted” will not appear to the far right, and one or more synonyms will be listed after the species. Symbols between the name you looked up and its synonym will explain the relationship between the two names. If the synonym is part of the same genus, you may use the family name and number to look up the synonym (using the instructions to volume 1).

If the synonym is in a different genus, you will need to look up that genus in the Guide to Family Numbers (volume 1, p. 7). For example, had you looked up *Rhus radicans* in volume 1 to see if it were the accepted name for poison ivy, you would not have found it. Then you would look up *Rhus radicans* in the synonymy and find *Toxicodendron radicans* listed as a synonym. Then you could look up *Toxicodendron* in the Guide to Family Numbers and proceed as described on page 1 of volume 1.

If the name you are looking up is a subspecies or variety, a synonym may not be listed. If one is not listed, check to see if the species, listed above the subspecies or variety, has “Accepted” written in the right-hand column. If it does, the species is the accepted name. For example, *Abronia angustifolia* var. *arizonica* (p. 5) is not an accepted name and has no synonym listed. However, the species *A. angustifolia* is accepted, so that is the name you should use.

Also, if a synonym is listed for a species, varieties and subspecies under that species will take the synonym of the species unless a separate synonym is shown for them. For example, *Acer grandentatum* var. *brachypterum* (p. 7) has no synonym listed. *Acer grandentatum* is not accepted, but a synonym is listed. That synonym would also be used for *A. grandentatum* var. *brachypterum*. *Acer grandentatum* var. *sinuosum*, however, has a separate synonym listed, which is the correct synonym.

In rare instances, you may find one of two other possibilities. If the plant is not listed, the name was not included in our sources and the consultants did not consider it a valid name. If the species is listed but no synonym is given, then it was included in our sources, our consultants considered it invalid for a United States plant, but they could not determine the valid synonym. If you encounter either of these possibilities and the plant is important on your site, you probably should submit a herbarium specimen for identification by a local or national authority.

## Legends for the Synonymy

### Symbol (Garrison-Skovlin-Poulton System)

Basic five-letter symbols, consisting of the first five letters, are used for the generic name. If the name has fewer than five letters, “+” signs are added to make a five-letter symbol. For example, for fir trees, *Abies*, the symbol is ABIES; for wheatgrasses, *Agropyron*, the symbol is AGROP; for bluegrasses, *Poa*, the symbol is POA++; and for maples, *Acer*, the symbol is ACER+.

Tiebreakers are added to the basic five-letter symbol if needed. For example, the symbol CHRYS is the first five letters of several genera—*Chrysopsis*, *Chrysopogon*, *Chrysothamnus*, and *Chrysanthemum*. The genus symbol for the first one is CHRYS and for the others CHRYS2, CHRYS3, and CHRYS4.

The symbol for a species is the first two letters of the genus and the first two of the species. For example, the symbol for Kentucky bluegrass, *Poa pratensis*, is POPR. All other plants having the same four-letter symbol have tiebreakers in numeric sequence, starting with 2. Examples: POPR2, POPR3, and so forth.

For varieties or subspecies, the first letter of the variety in a trinomial or quadrinomial or of the subspecies in a trinomial is added to the basic four-letter plant name symbol.

Example: *Pinus ponderosa* variety *arizonica* has the five-letter symbol PIPOA.

### Genus/Species

The species is indented below the genus, and the infraspecies name below the species. If the infraspecies is a subspecies, the letter *S* precedes it. If a variety is assigned to a subspecies, its position in the list reflects that assignment. The letter *X* precedes the name of a hybrid taxon. Thus, *X AGROELYMUS* is a hybrid genus, and “*X STELLOIDES*” is a hybrid species under the genus QUERCUS. Under *Eriophorum* is the species *angustifolium*; under the species is the subspecies *subarticum*; and under *subarticum* is the variety *coloratum*. So the full name is the quadrinomial, *Eriophorum angustifolium* ssp. *subarticum* var. *coloratum*.

### Synonym

The synonyms listed are almost always accepted names. Several symbols are used to clarify further the relationship of plant names and their synonyms.

- #—Our consultants determined that the names had the same type (the specimen on which the original description and name of a taxon have been based).
  - (—The name above this symbol has a type that is included in the description of the following name. A name preceding this sign cannot be an accepted name.)
  - )—The description for the name above the symbol includes the type of the name after the sign.
- ==—The two names linked by this symbol have been used for the same plant by at least one source. If the name is used correctly and we know it, the # sign will be used.
- >—One or more sources have used the name above the sign to include plants covered by other sources’ descriptions for the name following the sign.
- <—Plants covered by the description of the plant name above the sign have been included in the description of the name after the sign by one or more sources.
- N—Some sources or consultants believe the name above the sign has been misapplied to the name after it.
- \*—The two names have been used for the same plant, but our consultants could not determine if another sign could be substituted.

Occasionally, more than one synonym appears with one or more of the above symbols. The synonyms are accepted, but the plant specimen could be either of the accepted names.

### Author

An asterisk following an author means that the Smithsonian Institution studied the original description fully enough to confirm that it is accurately cited and that it complies with the International Code of Botanical Nomenclature (1978, International Association for Plant Taxonomy, Utrecht, Netherlands).

### Source Manuals

Letters, numbers, or symbols in this column correspond to the letters in parentheses in the following list of publications, which includes all major sources that our consultants used. Sources that are listed but do not have symbols in parentheses are mainly checklists. Numbers to the left of the sources give the region to which the source applies.

### Habit

The status—native (N) or introduced (I)—refers to the region or regions nominally covered by the particular part of the checklist: the United States and Canada, Hawaii, or the Caribbean region. If we do not know the status, an asterisk appears instead of N or I. A blank space appears in the first position of the Habit column, in place of any of those three symbols, for a species of which only varieties other than the type variety have grown spontaneously in the United States. Combinations of codes such as AP, ST, or ZE indicate a variable growth cycle, habit, or special habitat.

The codes are as follows:

N	Native	—	Saprophytic
I	Introduced	\$	Succulent
A	Annual	W	Woody
B	Biennial	H	Partly Woody
P	Perennial	G	Grasslike (Families 036, 037, 053)
Z	Submersed	V	Vine
E	Emergent	F or ;	Herbaceous (other than G or V)
/	Floating	S	Shrub
@	Epiphytic (Indicated only if on trees)	T	Tree
+	Parasitic		

### Family Name/No.

Family names follow the system used by the United States National Herbarium, Smithsonian Institution, Washington, D.C.

Synonymy for the National List of Scientific Plant Names
